## IN THE CLAIMS:

48. (Previously added) A method of recovering copper from a copper bearing sulphide mineral slurry which

## includes the steps of:

- (a) subjecting the slurry in a reactor to a bioleaching process at a temperature in excess of 40°C;
- (b) supplying a feed gas which contains in excess of 21% oxygen by volume, to said slurry;
- (c) controlling dissolved oxygen concentration in said slurry at a level of from 0.2 x  $10^{-3}$  kg/m³ to  $10 \times 10^{-3}$  kg/m³ by controlling at least one of the following: an oxygen content of said feed gas; a feed gas supply rate; a rate of feed of said slurry to said reactor; and
- (d) recovering copper from a bioleach residue of the bioleaching process.
- 49. (Previously added) The method according to claim 48 further including preleaching said slurry prior to said bioleaching process of step (a).
- 50. (Previously added) The method according to claim 49 wherein said the pre-leaching is effected using an acidic solution of copper and ferric sulphate.
- 51. (Previously added) The method according to claim 48 further including removing ferric arsenate from said bioleach residue before step (d).

- 52. (Previously added) The method according to claim 51 further including removing ferric arsenate by precipitation.
- 53. (Previously added) The method according to claim 48 further including subjecting said bioleach residue to a neutralisation step which produces carbon dioxide which is fed to said feed gas of step (b) or directly to said slurry.
- 54. (Previously added) The method according to claim 48 furthering including recovering copper in step (d) using a solvent extraction and electrowinning process.
- 55. (Previously added) The method according to claim 54 further including feeding oxygen generated during the electrowinning process to said feed gas of step (b), or directly to said slurry.
- 56. (Previously added) The method according to claim 54 further including supplying raffinate, produced during the solvent extraction, to at least one of the following: said bioleaching process of step (a), and an external heap leach process.
- 57. (Previously added) The method according to claim 54 further including feeding oxygen generated during said electrowinning process to said feed gas of step (b) or directly to said slurry.

- 58. (Previously added) The method according to claim 48 wherein said slurry contains at least one of the following: arsenical copper sulphides, and copper bearing sulphide minerals refractory to mesophile leaching.
- 59. (Previously added) The method according to claim 58 wherein said slurry contain chalcopyrite concentrates.
- 60. (Previously added) The method according to claim 48 wherein said feed gas contains in excess of 85% oxygen by volume.
- 61. (Previously added) The method according to claim 48 further including controlling a carbon content of said slurry.
- 62. (Previously added) The method according to claim 48 further including controlling a carbon dioxide content of said feed gas in a range of from 0.5% to 5.0% by volume.
- 63. (Previously added) The method according to claim 48 wherein said bioleaching process is carried out at a temperature in a range of from 40°C to 100°C.
- 64. (Previously added) The method according to claim 63 wherein said temperature is in a range of from 60°C to 85°C.

- 65. (Previously added) The method according to claim 48 further including bioleaching said slurry at a temperature of up to 45°C using mesophile microorganisms.
- 66. (Previously added) The method according to claim 65 wherein said microorganisms are selected from the genus groups comprising *Acidithiobacillus*; *Thiobacillus*; *Leptosprillum*; *Ferromicrobium*; and *Acidiphilium*.
- 67. (Previously added) The method according to claim 66 wherein said microorganisms are selected from the group comprising Acidithiobacillus caldus; Acidithiobacillus thiooxidans; Acidithiobacillus ferrooxidans; Acidithiobacillus acidophilus; Thiobacillus prosperus; Leptospirillum ferrooxidans; Ferromicrobium acidophilus; and Acidiphilium cryptum.
- 68. (Previously added) The method according to claim 48 further including bioleaching said slurry at a temperature of from 45°C to 60°C using moderate thermophile microorganisms.
- 69. (Previously added) The method according to claim 68 wherein said microorganisms are selected from the genus groups comprising *Acidithiobacillus*; *Acidimicrobium*; *Sulfobacillus*; *Ferroplasma*; and *Alicyclobacillus*.

- 70. (Previously added) The method according to claim 69 wherein said microorganisms are selected from the group comprising Acidithiobacillus caldus; Acidimicrobium ferrooxidans; Sulfobacillus acidophilus; Sulfobacillus disulfidooxidans; Sulfobacillus thermosulfidooxidans; Ferroplasma acidarmanus; Thermoplasma acidophilum; and Alicyclobacillus acidocaldrius.
- 71. (Previously added) The method according to claim 64 further including bioleaching said slurry at a temperature of from 60°C to 85°C using thermophilic microorganisms.
- 72. (Previously added) The method according to claim 71 wherein said microorganisms are selected from the genus groups comprising *Acidothermus; Sulfolobus; Metallosphaera;*Acidianus; Ferroplasma; Thermoplasma; and Picrophilus.
- 73. (Previously added) The method according to claim 72 wherein said microorganisms are selected from the group comprising Sulfolobus metallicus; Sulfolobus acidocaldarius; Sulfolobus thermosulfidooxidans; Acidianus infernus; Metallosphaera sedula; Ferroplasma acidarmanus; Thermoplasma acidophilum; Thermoplasma volcanium; and Picrophilus oshimae.
- 74. (Previously added) A plant for recovering copper from a copper bearing sulphide mineral slurry which includes a reactor vessel, a source which feeds a copper bearing sulphide mineral slurry to said vessel wherein a bioleaching process is carried out at a temperature in excess of 40°C, an oxygen source which supplies oxygen in a form of oxygen enriched gas or substantially

pure oxygen to said slurry, a device which measures a dissolved oxygen concentration in said slurry in said vessel, a control mechanism whereby, in response to said measured dissolved oxygen concentration, the supply of oxygen from said oxygen source to said slurry is controlled to achieve a dissolved oxygen concentration in said slurry of from  $0.2 \times 10^{-3} \text{ kg/m}^3$  to  $10 \times 10^{-3} \text{ kg/m}^3$ , and a recovery system which recovers copper from a bioleach residue from said reactor vessel.

## 75. (Canceled)

76. (Currently amended) The plant according to claim 75 74 further including a preleaching stage for leaching said copper bearing sulphide mineral slurry before said slurry is fed to said reactor vessel.
